dose to normal tissue and underdosing the target.^{210–212} The efficacy of respiratory gating is affected by the reproducibility of a patient's breathing patterns from cycle-to-cycle and day-to-day. Respiratory gating increases treatment time as compared to nongated treatments; published duty cycles (ratio of beam on to total beam delivery time) range from 30% to 50%.^{213–215} Increasing the dose rate, if possible, would counteract the increase in treatment time. Another consideration is the amplitude of the respiratory motion. Several reports have shown that the benefit of gated beam delivery is minimal and does not outweigh the increase in treatment time and complexity for patients with motion amplitudes smaller than 2 cm.^{119,210,216}

SlowCT/CT Fusion

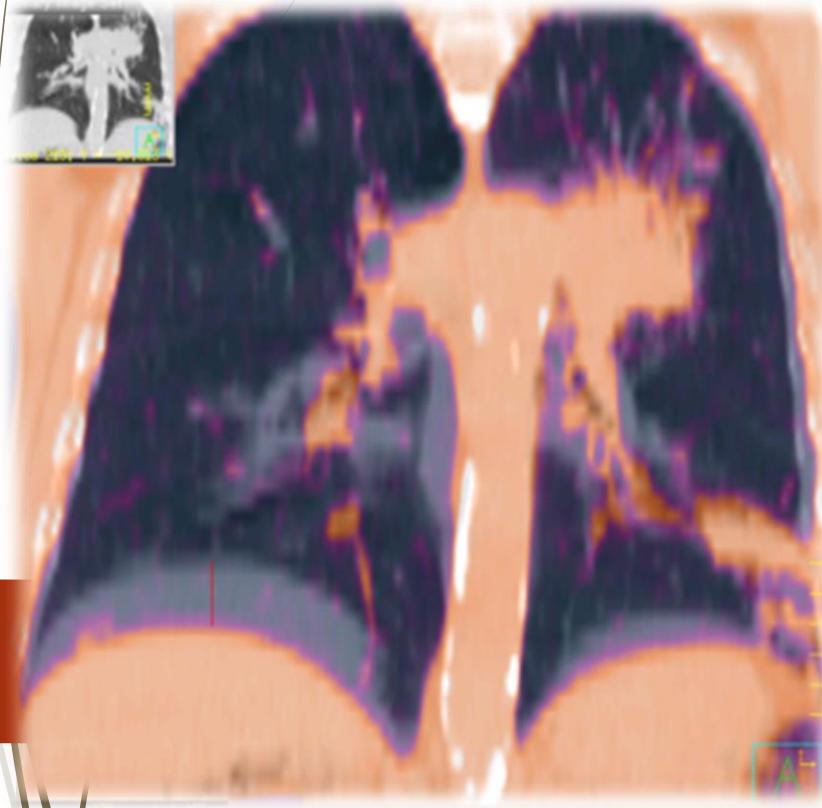

Fig. 1. The patient, in an anti-algic effort, tries to breath only with right hand side of the diaphragm, sustaining a marked costal breathing

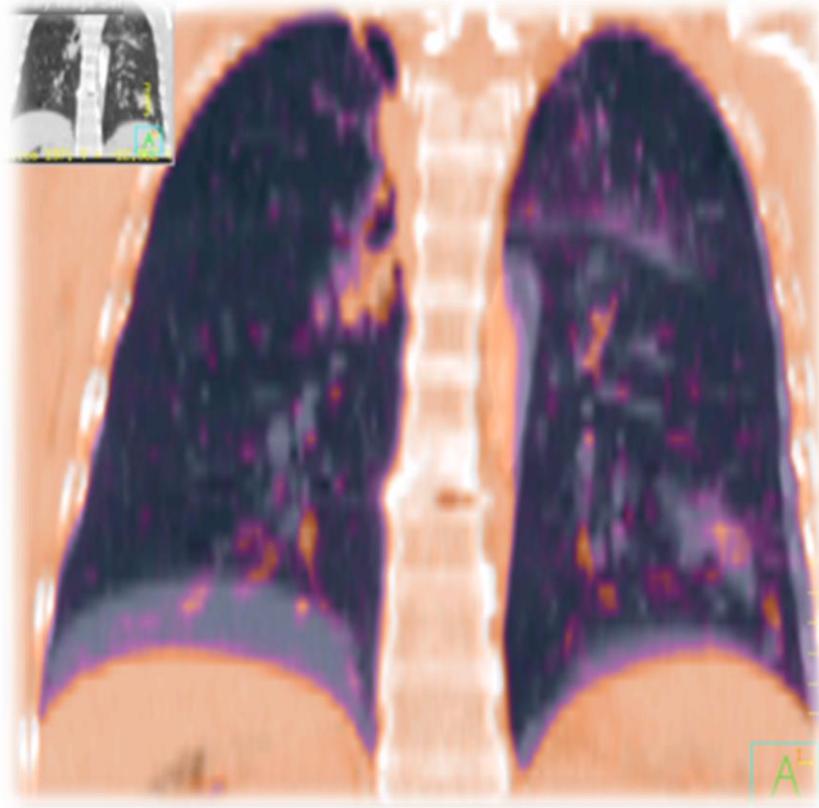

Fig. 2. In a coronal plane posterior to the tumor, the effect cited in Fig. 1. becomes notorious

SlowCT/CT Fusion

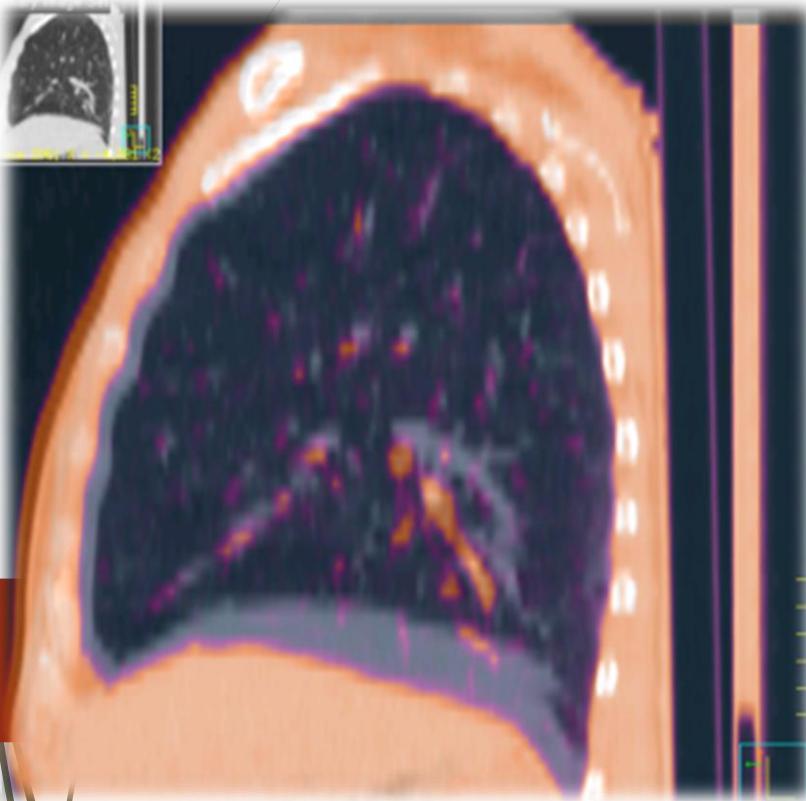

Fig. 3. The contralateral lung displays a marked caudo-craniial movement, even at bronchial level

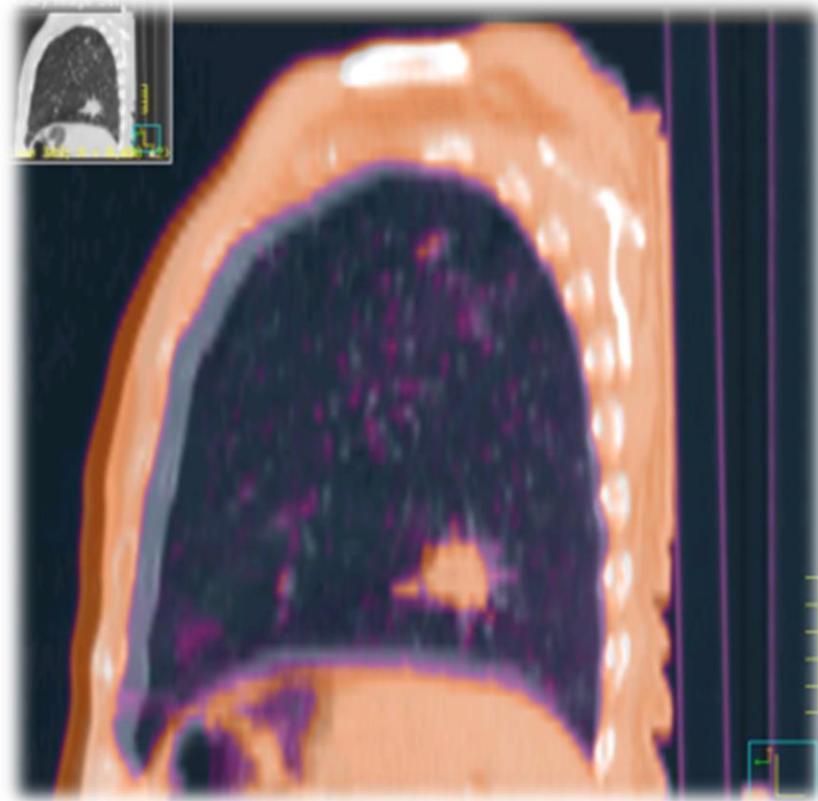

Fig. 4. On the ipsilateral lung, costal breathing is clearly noticeable with the diaphragm almost still. Its ITV is much lower than expected

SlowCT/CT Fusion

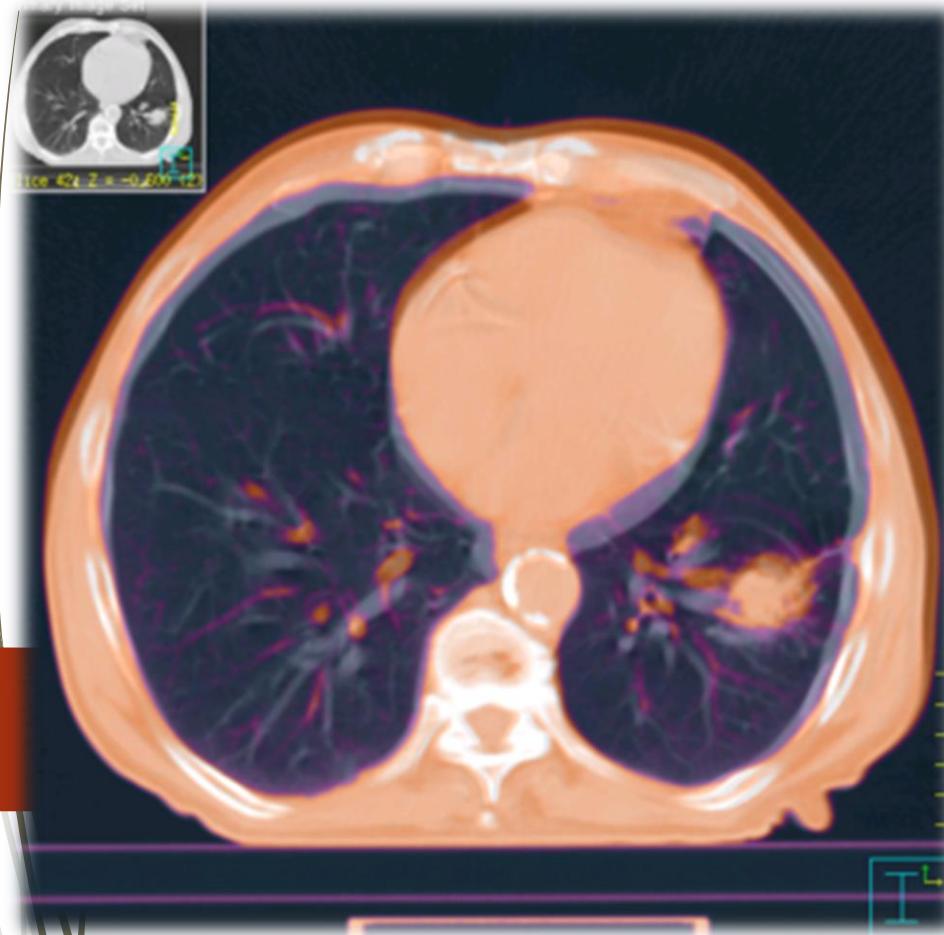

Fig. 5. The main movements in a tumour on the diaphragm are surprisingly anteroposterior. A diaphragm compression is the worst option.

RADIATION THERAPY ONCOLOGY GROUP

RTOG 0236

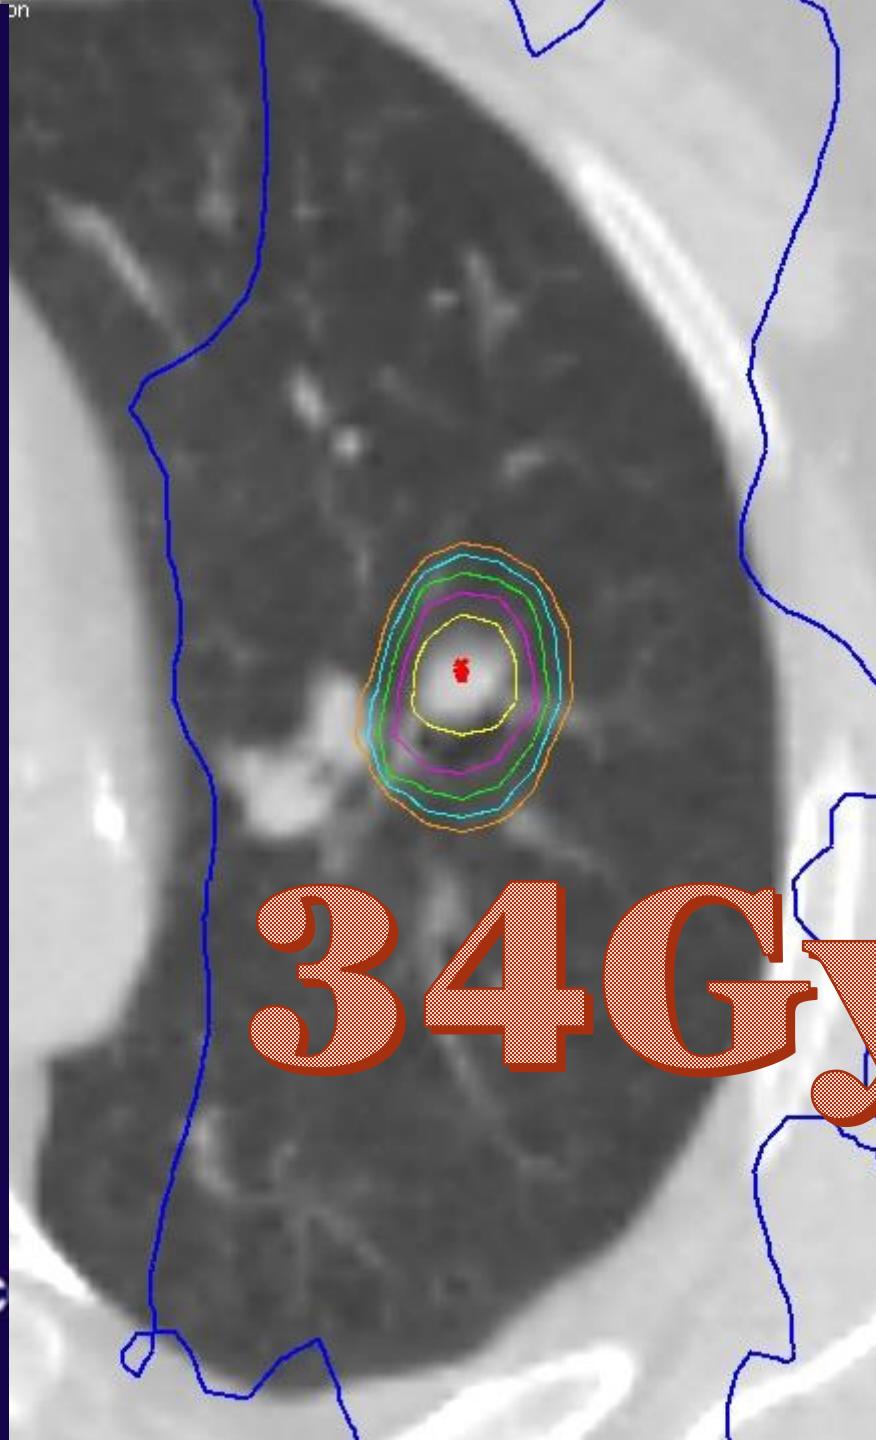

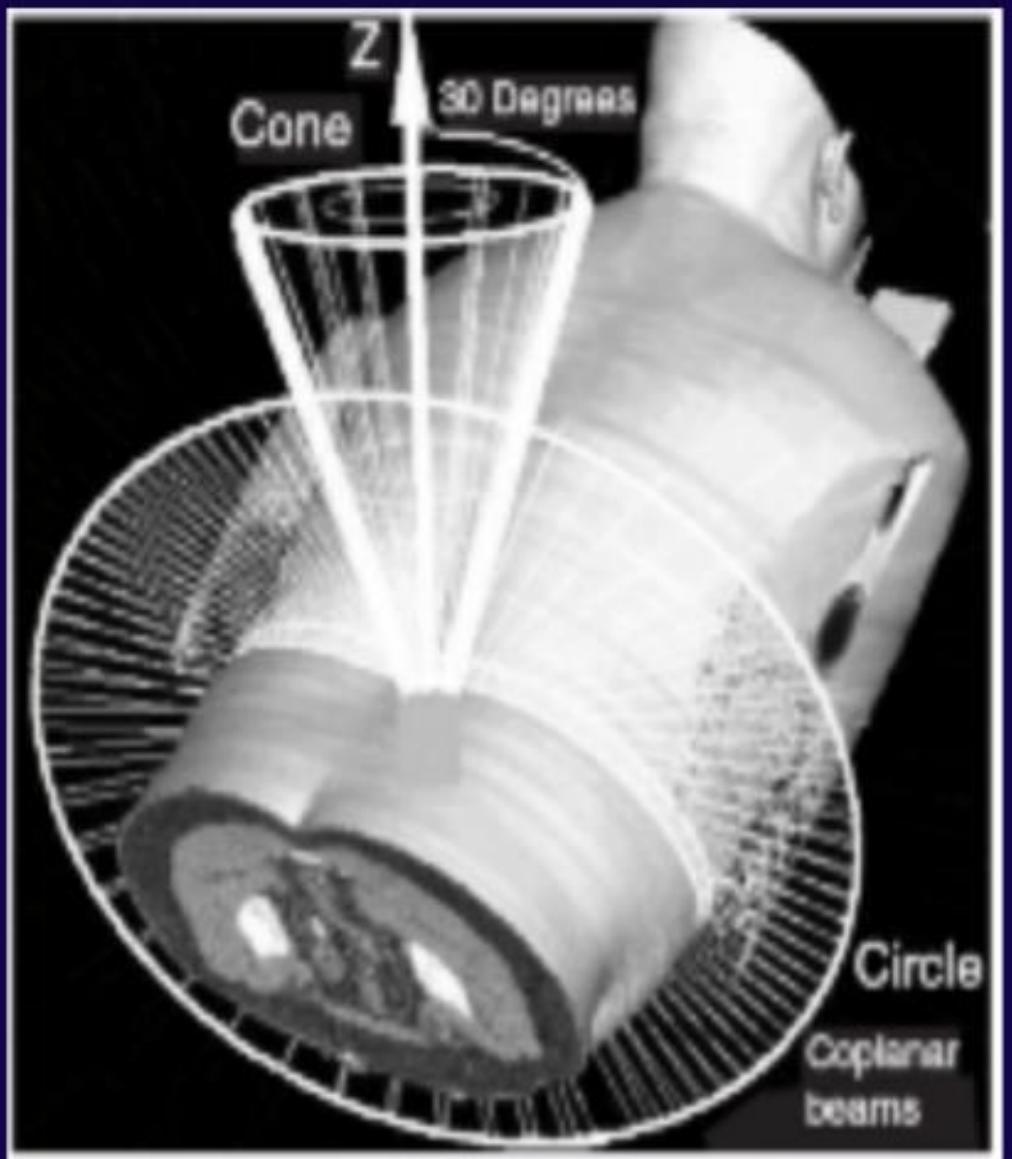

A Phase II Trial of Stereotactic Body Radiation Therapy (SBRT) in the Treatment of Patients with Medically Inoperable Stage I/II Non-Small Cell Lung Cancer

6.0 RADIATION THERAPY Note: intensity Modulated RT (IMRT) Is Not Allowed

6.1 Dose Specifications

6.1.1 *Stereotactic Targeting and Treatment*

The term "stereotactic" for the purposes of this protocol implies the targeting, planning, and directing of therapy using beams of radiation along any trajectory in 3-D space toward a target of known 3-D coordinates. This differs from conventional radiation therapy in which therapy is directed toward skin marks or bony landmarks that are indirectly referenced to the tumor. This protocol will require treatments to be conducted with the use of a fixed 3-D coordinate system defined by fiducials. The coordinate system defined by the fiducials should be directly related to the radiation producing device (e.g., couch and gantry) in a reproducible and secure fashion. Capability should exist to define the position of targets within the patient according to this same 3-D coordinate system. As such, the patient is set up for each treatment with the intention of directing the radiation toward an isocenter or target according to the known 3-D coordinates as determined in the process of treatment planning. The nature of the fiducials themselves may

Restricted deliverable beam space

Alteración de la densidad en SBRT

RADIATION THERAPY ONCOLOGY GROUP

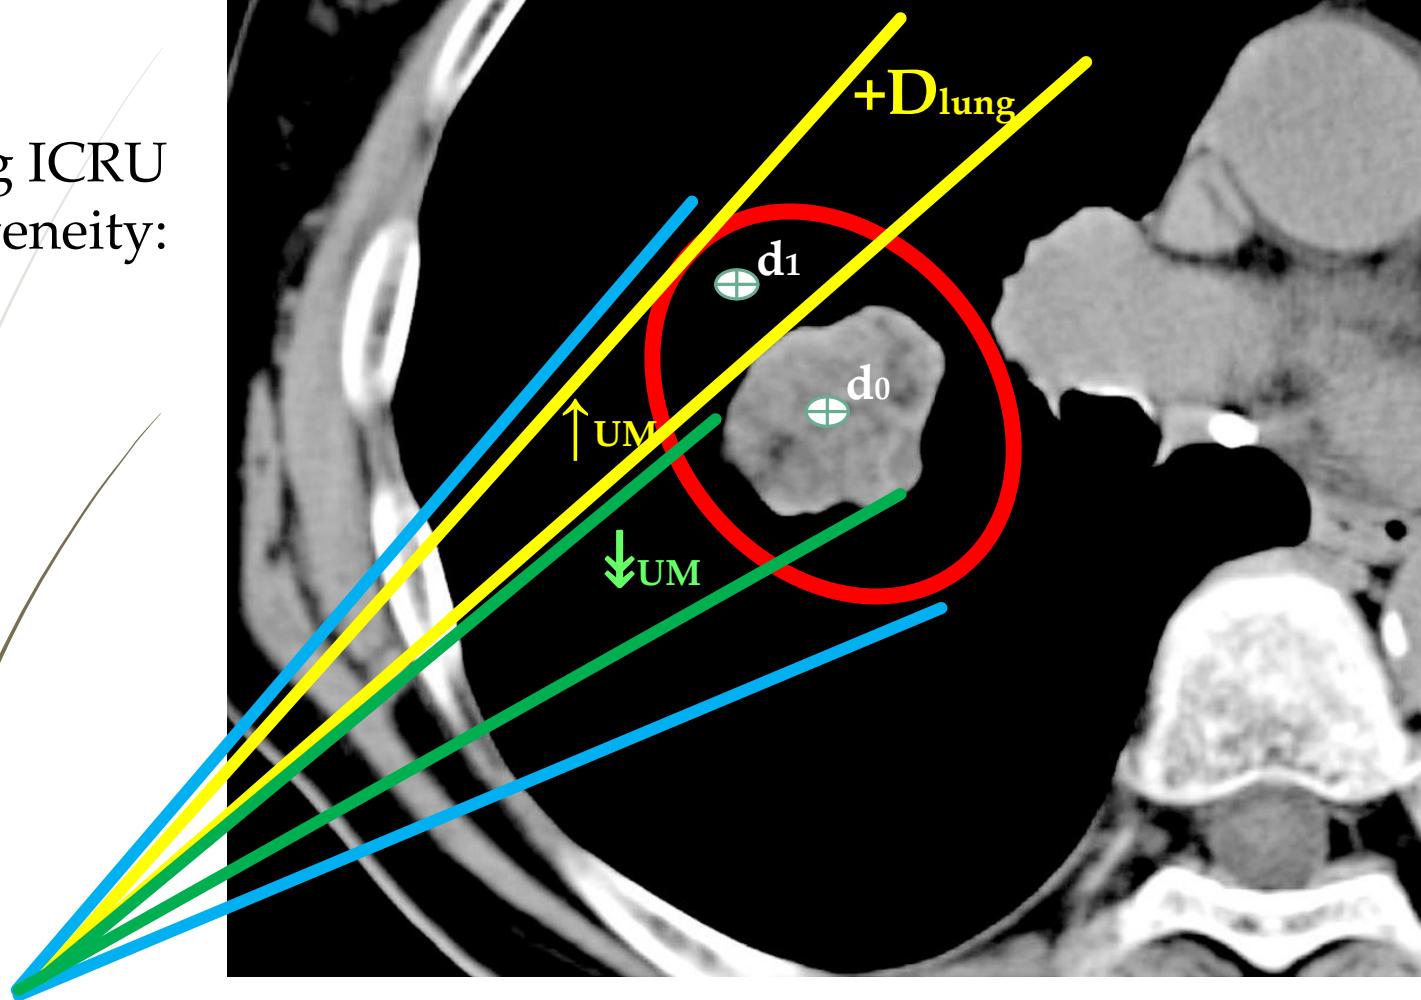

RTOG 0618

A Phase II Trial of Stereotactic Body Radiation Therapy (SBRT) in the Treatment of Patients with Operable Stage I/II Non-Small Cell Lung Cancer

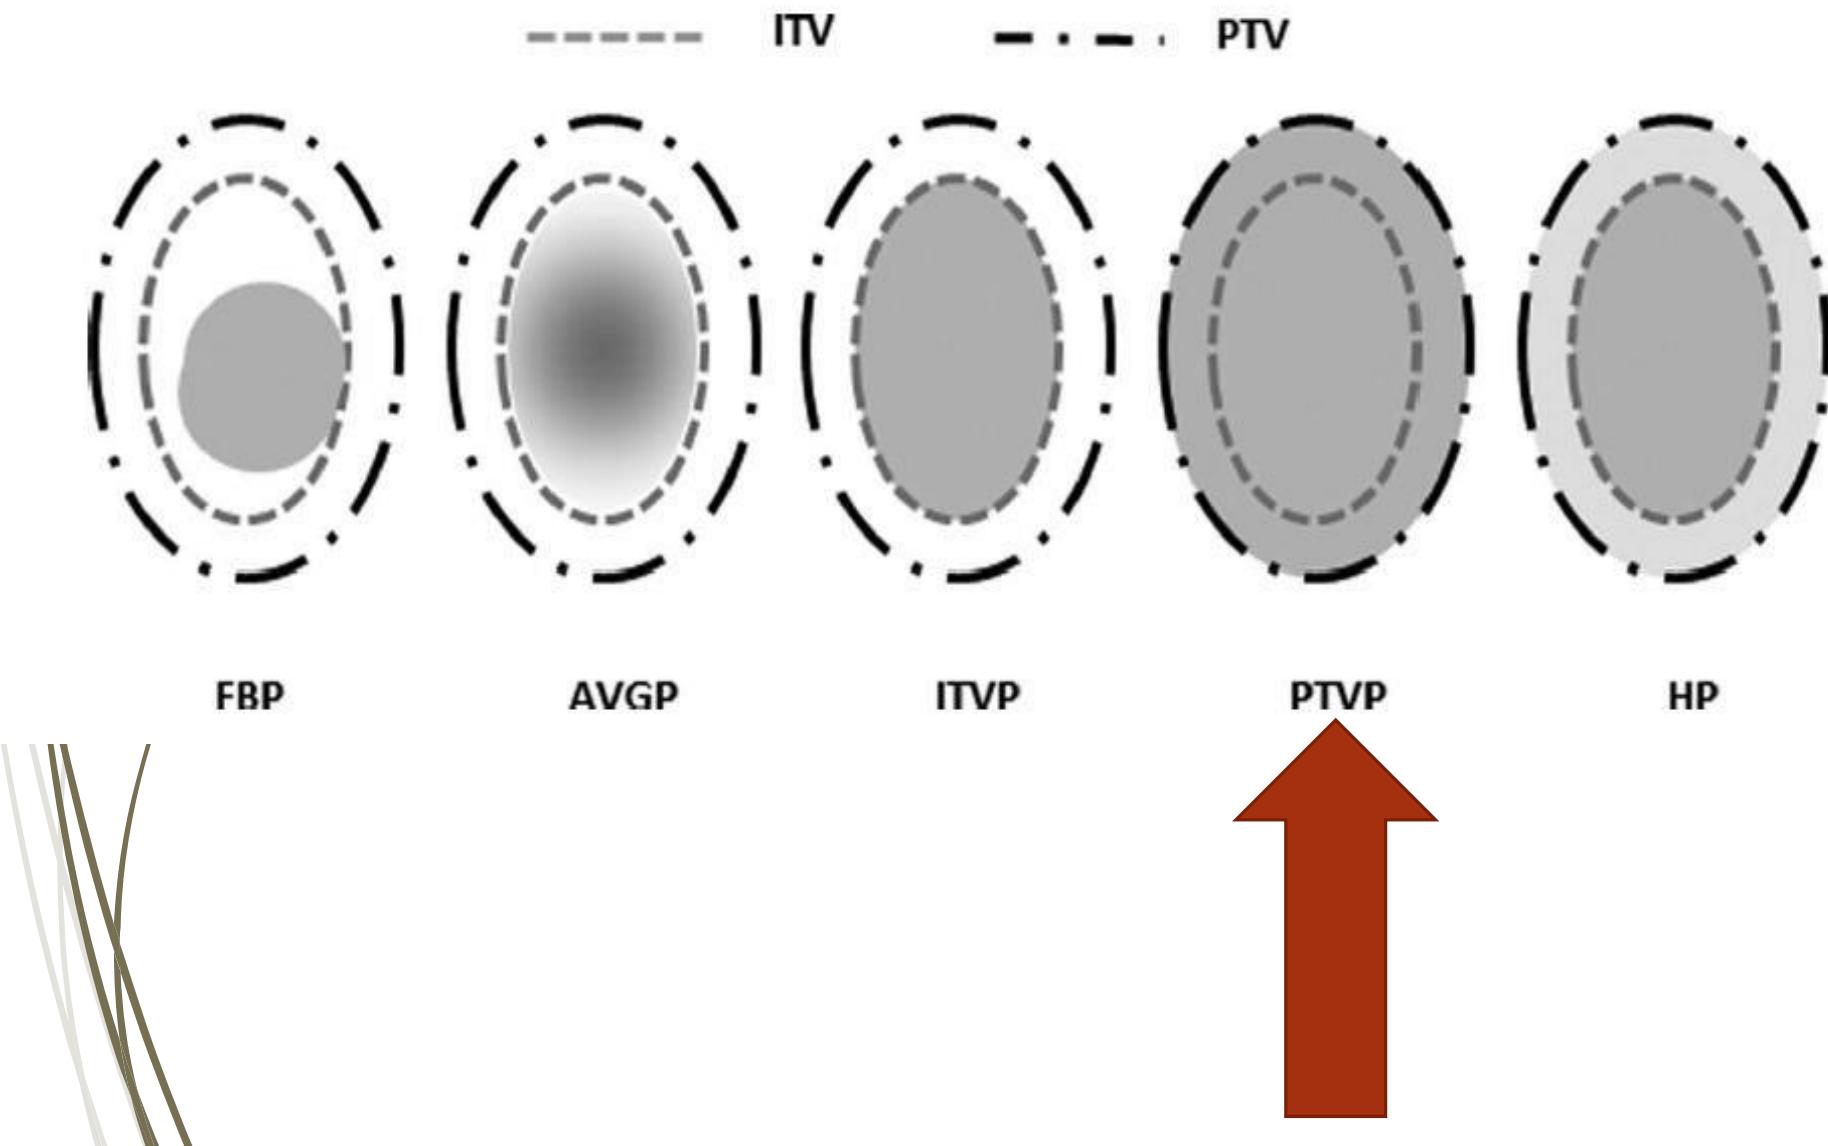

Study Team (10/25/12)

For purposes of dose planning and calculation of monitor units for actual treatment, all tissues within the body, including lung, will be assumed to have unit (water) density (no correction for tissue heterogeneity). However, for QA purposes, each plan should also be calculated with software vendor supplied heterogeneity corrections for density enabled. In order for ITC (the QA center) to make an accurate comparison between these plans, the computation using heterogeneity corrections should have beam weights manipulated such that the number of monitor units is the same for each beam between the plans. Both plans (with and without heterogeneity correction) will be submitted to the ITC for comparison. Again, calculation of the accelerator monitor units for the actual patient treatment should reflect the plan where all tissues are assumed to have unit (water) density.

Getting ICRU
homogeneity:
 $d_1 = d_0$

Med Phys: 41:081707 (2014):

From the results we can
recommend
alteration of the density
only between
3cm to 10cm
of PTV diameters.

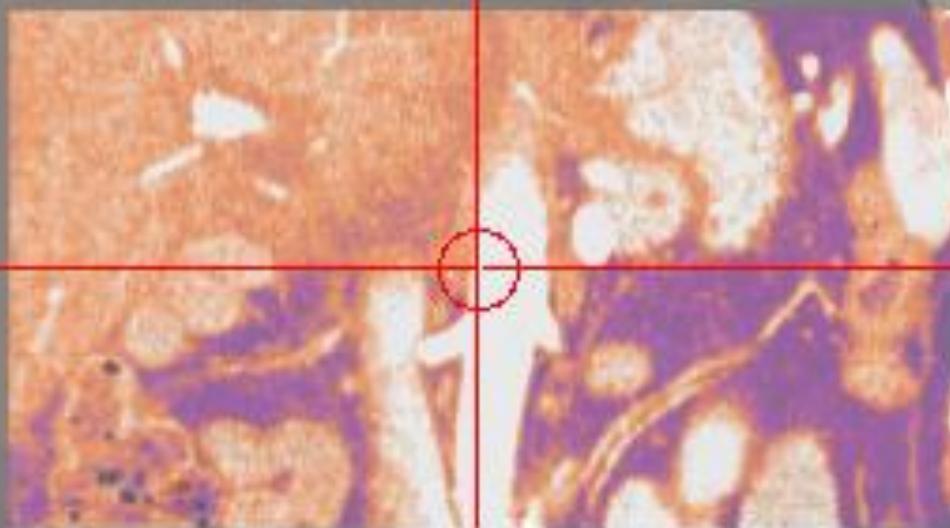

The mean overall correction values of post-treatment IGRT were:
lateral 1.0 ± 1.3 mm,
longitudinal 0.9 ± 1.2 mm and
vertical 1.1 ± 1.5 mm,
time from star to end irradiation was
 7.6 ± 2.0 minutes
for 18-20Gy per fraction,
and relative increase in volume between
GTV and ITV was 33.9%.

MULTIDAMPENING Y MÁRGENES NEGATIVOS EN SABR PANCREÁTICA CON PRESCRIPCIONES SIP

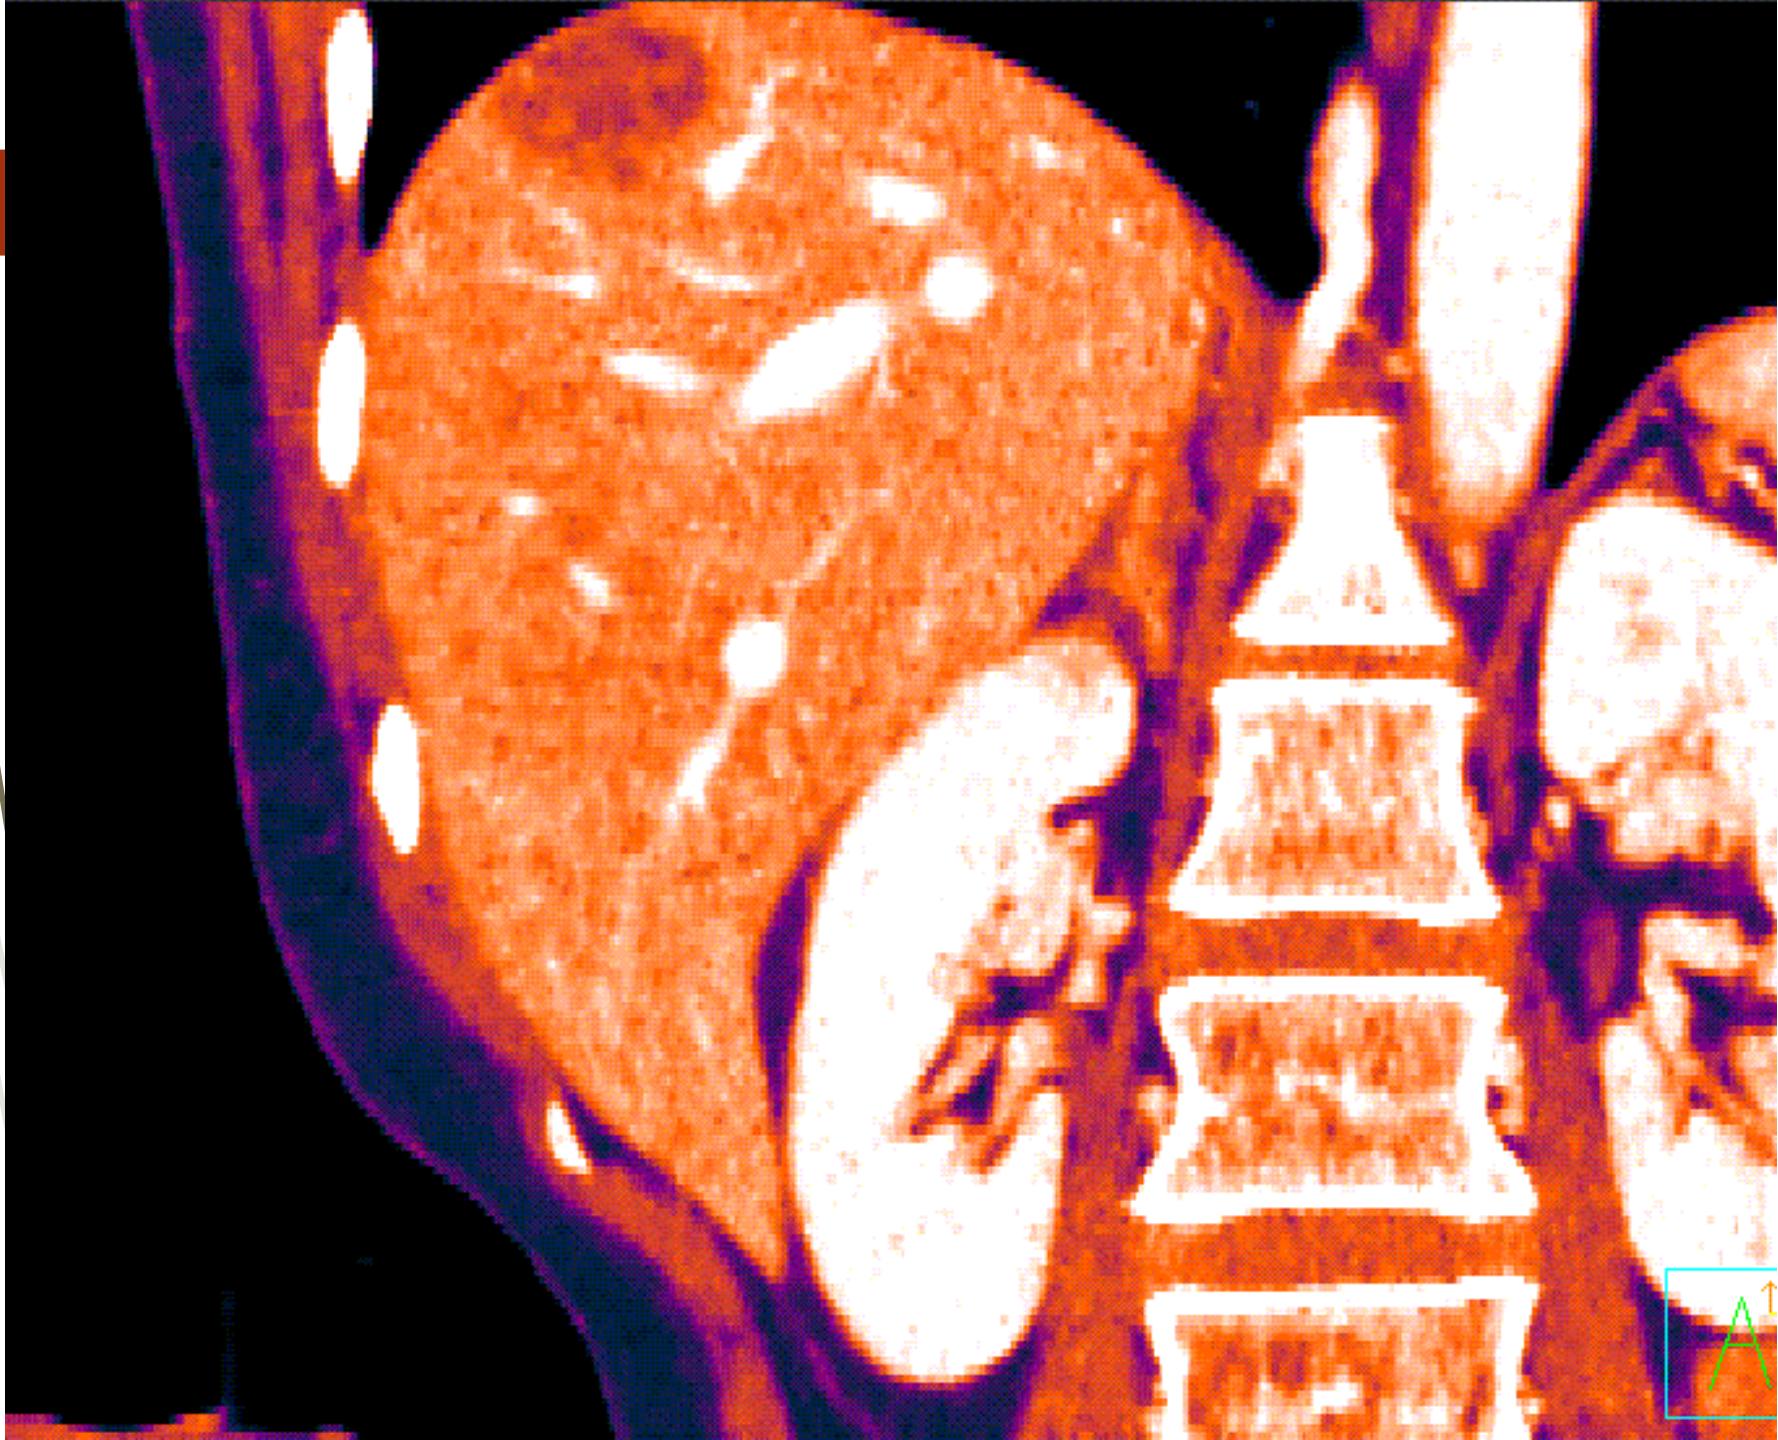

Introducción y Objetivos

La SABR en cáncer pancreático se ve condicionada en muchas ocasiones por la presencia de órganos de riesgo (OAR) adheridos a las lesiones, lo que no permite las prescripciones ablativas propias de la técnica.

En este trabajo se describe tanto el procedimiento de simulación con multidampening como la *class solution* implementada en nuestro hospital en SABR pancreática con prescripciones SIP (Simultaneous Integrated Protection), que se focaliza en las interacciones no poissonianas de la muerte celular para permitir salvar las tolerancias del tejido sano y cubrir los objetivos de control tumoral.

When a thing was new
people said: "**It's not true**"

Later, when its truth became obvious,
people said:
"Anyway, it's not important"

And when its importance could not be
denied, people said:
"Anyway, it's not new"
